

Sotheby's Green Lights Major Exhibit With Art Guard MAP Gold

Sotheby's NY held a major exhibition of art and precious objects from the Chatsworth House, the famed seat of the Duke of Devonshire that contains some of the UK's most valuable treasures. In addition to paintings and formal attire the exhibit included jewelry, in particular a diamond tiara worn by the Duchess that was displayed resting on a pillow. Chatsworth had very specific guidelines about security for the exhibit, including state-of-the-art object-specific protection, which Art Guard's MAP Gold System completely satisfied. According to Head of Security, Michael Seremetis, this exhibit would not have taken place without the Art Guard solution.

In addition to Art Guard's MAP sensors on 25 objects, door sensors were placed on key entry/exit points. Instantaneous sensor and system data communicated to the facility's security desk through IP and to key responders by text and email.

The self-contained MAP System Gold works with the Alula Connect+ control hub with dual path communications and encrypted signals. Installed on site or delivered as a plug-and-play system with pre-enrolled sensors and peripheral devices, including door/window sensors, cameras, repeaters, environmental sensors and wireless sirens, the Gold System provides always-on primary or secondary protection from theft of art and valuable assets with the operational ease of home automation. The Gold System's coverage and flexibility makes it a favorite among private collectors, museums, galleries, auction houses and hotels around the world.
